Error Report 1930

When a campus uses the Prorate Leave option (i.e., System Parameter 285 has a non-zero value), module PPLVPRAT may perform an unending DB2 cursor fetch process when the numerical day of the Pay Cycle End Date exceeds the numerical day of the calculated Prorate Leave Cutoff Date. This error is caused by an improper use of the CPPDXDC3 end-of-month utility by PPP390 which passes an invalid ISO date to the cursor selection in PPLVPRAT. When this error is triggered, message 39-135 (See Operations) is issued until the program is cancelled by external intervention.

Programs

PPP390
Program PPP390 has been corrected to move the first day of the month to the calculated Prorate Leave Cutoff Month. This action will cause the CPPDXDC3 end-of-month routine to function properly.

Test Plan

Test materials are not provided with this release. This is a minor program change (insertion of one source statement). To verify the correct installation of this release, perform a “before/after” regression test of PPP390. Any standard cycle run of PPP390 which terminates normally is adequate. There should be no differences observed between the two runs.

Installation Instructions

1. Install the release modified COBOL member PPP390.
2. DB2 pre-compile, compile and link the Batch Use program PPP390 into Batch LOADLIB.
3. Bind the plan for program PPP390.
4. Perform the installation testing.
Timing of Installation

This release is Urgent, especially if your campus uses the Prorate Leave option, and should be installed as quickly as possible to avoid the condition identified in the above error report.
